

A Getis-Ord Gi* hot- and cold-spots of under-five mortality

Empirical-Bayes district rates, self-inclusive contiguity weights, $p < 0.05$

B Statistically significant Kulldorff space-time scan clusters

Cluster 1 (most likely): 2007-2016, relative risk 1.63, 184 observed vs 118.4 expected deaths, $p = 0.001$

Expected counts are indirectly standardised by age segment within birth period, so a cluster is high relative to the national level at the same date.
